

VDI is not a one-size-fits-all solution

Desktop virtualization enables new levels of IT security, ease-of-management and cost-savings. But it's not a one-size-fits-all solution. Specific user groups within your organization have unique requirements, each demanding their own approach and treatment.

The Desktop Virtualization Viability Assessment

Unlike other assessments, Softchoice's Desktop Virtualization Viability Assessment (DVVA) avoids the pitfalls of an "all-or-nothing" approach when creating your virtualization roadmap. Instead, we develop an in-depth view of your diverse user-groups and chart out the best course of action for each one. This is how we ensure you deliver an optimal desktop experience to users across your entire organization.

Our vendor-agnostic assessment determines the viability and possible extent of virtualization in your desktop environment, based on the makeup and requirements of end-users. We make no assumptions and the feedback we deliver is tailored to reflect the realities of your business.

Determining your viability involves 3 phases.

Our goal is to evaluate 100 percent of your desktop environment – even the systems that won't be viable for virtualization – to define all your user-profiles and worker behaviors. From there we develop a series of recommendations and ultimately provide step-by-step deployment support.

Phase 1: Identify application portfolios and end-user activity

- Non-intrusive, data-driven analysis of user group behaviors
- Each group is defined based on job role, location(s) and workload
- End result is a recommendation whether you would benefit from virtualizing your desktop environment and, if so, to what extent.

Decision time: is it worthwhile moving to Phase 2 to take a deeper look at your organization's work patterns?

Phase 2: Identify the impact of virtualization across user groups

- An in-depth analysis of the impact of desktop virtualization on your data center and network
- Identify opportunities to reduce cost of management and deployment
- Recommendations on how to deliver the best-possible end-user experience across every facet of your organization

From concept to reality.

Phase 3: Proof of concept

Working as an extended member of your IT Infrastructure Team, we design proof-of-concept deployments and support full-fledged rollouts – from acquiring the technology to implementing it in your environment.
